Science Highlights: Ecological Effects of Climate Change ...

Below is a sampling of some of NCEAS most influential and highly cited studies exploring the effects of climate change on organisms and their environment. Many of these studies provide the first global perspective of the ecological effects of climate change, and have informed effective policy making and natural resource management. [The ecology of climate change and infectious diseases ...](#) Latitudinal, altitudinal, seasonal, and interannual associations between climate and disease along with historical and experimental evidence suggest that climate, along with many other factors, can affect infectious diseases in a nonlinear fashion. However, although the globe is significantly warmer than it was a century ago, there is little evidence that climate change has already favored

This video focuses on the conifer forest in Alaska to explore the carbon cycle and how the forest responds to rising atmospheric carbon dioxide. Topics addressed in the video include wildfires, reflectivity, and the role of permafrost in the global carbon cycle.

[The Ecology of Climate Change - CLEAN](#)

Reducing the level of climate change and reducing human vulnerability to whatever climate changes do occur depend on the understanding of climate science, engineering capabilities, and other kinds of knowledge, such as understanding of human behavior and on applying that knowledge wisely in decisions and activities.

[Post, E.: Ecology of Climate Change: The Importance of ...](#)

Rising temperatures are affecting organisms in all of Earth's biomes, but the complexity of ecological responses to climate change has hampered the development of a conceptually unified treatment of them.

The boreal forest, which stretches across northern latitudes just south of the Arctic Circle, is a key region for studying climate change and not just the impacts.

[Climate Change and Microbial Ecology: Current Research and ...](#)

The distribution and function of microorganisms are of crucial importance for the flow of matter in the Earth's biogeochemical cycles. Effects of microbial communities on the carbon and nitrogen cycles are particularly important for producing climate gases such as CO<sub>2</sub>, CH<sub>4</sub>, or N<sub>2</sub>O.
