transformation as the duration of it is increased. In alloys G20, 80G23, and G25S it was not possible to supercool the austenite entirely, on account of which the isothermal $\gamma \rightarrow \alpha$ transformation took place in the presence of a slight amount of s-phase; this affects the kinetics of the process.

The great majority of phase transformations in metals occur by the growth of a new phase (P) from a few nucleation sites within the parent phase (a)-a nucleation and growth process. The a / P interface therefore plays an important role in determining the kinetics of phase transformations and is the most important class of interface listed. It is, however, also the most complex and least

The Theory of Transformations in Metals and Alloys

Suitable thermal and mechanical treatments will produce extensive rearrangements of the atoms in metals and alloys, and corresponding marked variations in physical and chemical properties. This book describes how such changes in the atomic configuration are effected, and discusses the associated kinetic and crystallographic features. It deals with areas such as lattice geometry, point defects
